Levered return against the hurdle

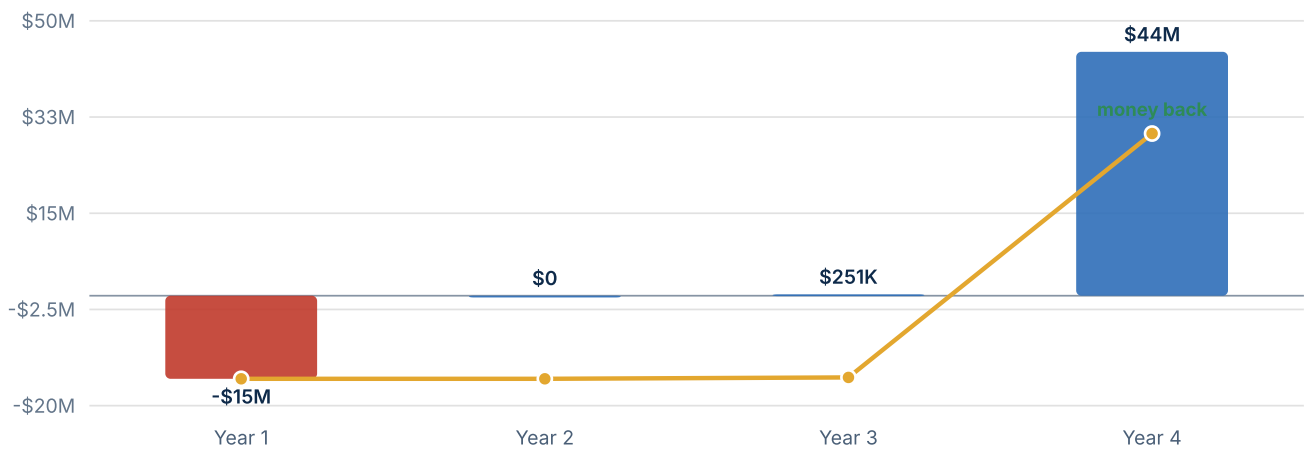

Equity of **$16.57M** builds a 120-unit project for **$43.42M** all-in and returns **$44.82M** over 4 years: **2.92x** and a **33.95%** levered IRR, **22.0 points above** the 12.00% hurdle.

Stabilised NOI of **$3.56M** gives a **8.91%** yield on cost, **391 bps** over the 5.00% exit cap (policy minimum 150 bps).

Operations return about **6.00%** of what equity gets back; the sale and refinancing return **94.00%**. The permanent loan of **$0** takes out the construction loan.

Equity cash flow

Each year's cash to equity; the line is the running total. Equity is funded through construction and lease-up, then returned from operations, the takeout and the sale.

Cost to date and loan balance

Cumulative cost including capitalised interest (dark) and the construction loan balance (blue), by month from closing.

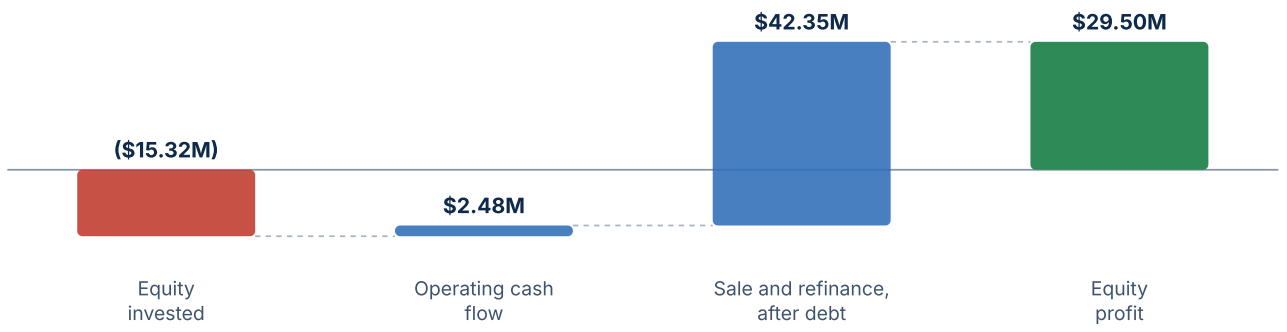

Figures in thousands of dollars. Each quarter's costs are funded by equity first, then the construction loan; interest is capitalised into the loan up to the commitment. Every figure is the funding engine's monthly schedule rolled up by quarter, through stabilisation.

ABOUT THIS SUMMARY

Prepared November 3, 2026 from the Punchlist Capital underwriting model (beta). Every figure is read from the live model for the Base case; the sensitivity grid and stress tests rerun the model. Development returns depend heavily on cost, schedule and exit assumptions. This summary is an analytical aid, not an offer or a fairness opinion. Check it against your own model before relying on it.
